

Build a Bat House

“Even the very presence of bats in an area can reduce insect populations as many insects can hear bats up to 100 feet away and will keep their distance from areas occupied by bats. ... Installing a bat house then is one of the most effective and environmentally friendly ways to reduce the mosquito population near your home. Bats can eat up to 1000 insects a night.” **Sounds perfect to me.** Check out the Canadian Wildlife Federation directions on how to build and install your own bat house.
